—/—/—

1] Command to kill Process in Linux

→ Kill process by name
"kill process-name"

This command terminates all process with the given name

→ Kill a process based on Process name
"kill process-name"

This command kill process by matching their names.

→ Kill a process using Process Id (PID)
"kill PID" or "kill -9 9127"

If the process does not terminate the process -9 forcefully terminates.

2] PID & PPID

→ PID is a process ~~id~~ identification number assigned to each process

→ PPID is a the ~~from~~ process ID of the Parent process.

Difference

PID	PPID
1] Unique ID of a process	1] ID of a Parent process
2] Assigned to every process	2] Exists only for child process
3] Helps as id identify process	3] Show process-child relation.

3] Orphan Process

→ An orphan Process whose Parent Process has terminated while the child process is still running

4] Zombie Process

→ A zombie Process is a process that has the completed execution but still has an entry in the process table because its Parent has not collected its exit status.

5] fork()

→ It is a system call used to create a new process. The newly created process is called the child process. The process that calls fork() is the parent process.
